

ABSTRACT

5 A netting material includes reflective and/or luminescent markers that make the netting visible in low light or reduced light situations, and in certain embodiments also marks the roll end in a manner visible in low light situations. The strip reflects a source of light even from a distance and even at a sharp angle, or alternatively emits light itself. The reflective or luminescent strip may be incorporated into the net in addition to and optionally alongside colored roll-end markers that are easily visible in daylight.
